

# My paper on the non-tested theory of Magnetism Powered Generator

by Anonymous electrical engineer

## Footnotes:

This is to extend my idea beyond ebook sites or document sites, that means my white paper. This is also to bring out the very principles of my idea on paper, articles, and blogs.

## Starting notes:

this generator has probably not been heard anywhere in the public or the energy community and probably for a good reason. In fact there are loads of conspiracy theories such as anybody who comes up with very efficient cars or ways to generate electricity get shot down by lawyers, assassinations, bribery, and high-up corporations buying up patents. Well whether these conspiracy theories are true or not that anybody who's a threat to the monopoly of energy, power corporations, and oil companies, especially with these high gas prices, high electric bills, and record breaking profits, I have made this idea public domain so anybody who invents my idea cannot be attacked because since it's public domain it would attract attention that would backfire on any corporation that does not adapt to changes (for example...RIAA+MPAA).

My idea will not destroy the economy, it will restore the economy that's being destroyed by the energy companies massive profits because in any economy if something gains, something dies. So let's start an example. Oil and gas co always has 40% of the total economy, technology companies has 30%, craft companies and other make about 10% of the total market share, and the rest goes to food companies which is about 20%. So if say the oil and gas co get greedy and start wanting more profits and start using demand or other excuses as a excuse and get the people to buy the excuses then it doesn't just effect travel and budgets, it effects every company in and out of the stock market. So let's say they raise it 2 times and then other companies have to pay more for gas, and energy, then the companies start losing money themselves. So then after the price hikes and possible tax hikes then this is the current economical status: since they are making double profits, then all other companies are effected like this since they have no means of upping gas millage twice as much so then let's think maybe their budgets have doubled and so they all lose half the percentage, so technology companies get reduced to 15%, craft companies and other turn from 10% to 5% and then food companies have to raise prices as well not not lose market share and so they stay at the same and so for the final report the oil and gas co gains 20% but then other companies are losing money and so they may have to cut jobs or raise prices to cope with the new costs. My example may be a non-valid example but what I am trying to say is that anytime you raise prices and people are forced to paying for it then they spend less on other things and then either they go out of business, they have to raise prices and expect people to pay, or cut jobs to take the new inflated costs. Now this probably sounds irrelevant but this generator can be made for cars as well because it would supply the energy for the motor. Anyways the same can be applied to not just gas, but also pure electricity because if they raise rates they can hurt every other company in the stock exchange including companies not apart of it.

## Summary:

So this entire document will be the theory behind the idea of a magnetism powered generator. This will be my white paper that will explain the theory behind all this. Anyways I will begin, This generator uses the power of magnetism to generate electricity, well magnets are already used to generate electricity but not to turn the generator that generates electricity, because it usually needs a external source such as wind, sun, coal, etc etc, but the idea behind this blueprint is a generator that requires nothing but magnets and also maybe just a few hand cranks to startup then generator and uses the force of repelling magnets to turn the

generator but also has the option to pull away the magnets to stop the generator for purposes of maintenance, too much energy, if there's signs of the generator going to mess up, or other purposes. Anyways the whole concept is the rod that's connected to the coils section that uses magnets to generate electricity which is what normal generators use, the entire wheel must be strong to run for very long periods of time and yet light enough to turn easily or without much effort. So then each certain inches away with have an embedded magnet either positive or negative sticking out of the rod, it will be connected to a separate rod that's connected to a lever which can turn the magnets towards the generator or away from it. The rod that's connected to the lever will have smaller rods that all have magnets that are the opposite, the idea is that once they are close to one another they must repel one another and since they can't move back, the magnets will force the rod with the magnets to start turning. So then if my theory works and is correct then it will generate electricity by itself unless the rod is pulled back and can be connected to a battery or batteries. A safety measure that must be taken with making these is that this generator must auto shut off if a battery can't be charged anymore to prevent a overload of electricity and also to prevent a meltdown or explosion with the battery. If electricity is used with ordinary appliances or anything else that uses electricity such as computers, battery chargers, etc, then the battery will keep going down while energy is being feeded into it thus keeping the electric flow going and at the same time won't cause a explosion or big problems with the battery. So that means something must run all the time, and my perfect idea on what should run all the time is a refrigerator because it has to run all the time to keep food cold. So once the regulation or balance system is made and connected to this generator then it will prevent any problems or issues that this generator will caused since it means your running a miniature power plant instead of being on the electrical grid provided by the power company and power plants.

Ending summary:

So this is my idea and is not perfected yet but may lead to personal, commercial, and government experiments on this generator and this is '**public domain**' to prevent patents from damaging companies rights to building these generators and families building these generators themselves. So under any court of law and any patent office, any patent attorney cannot successfully submit this idea to any patent office worldwide since public domain works cannot be accepted in the patent offices because it is declared public domain by the creator of this work. This idea is not perfect and has not been tested, and so this white paper and blueprints that were made were so that my idea can be tested and perfected by any engineer and published at their will at their discretion. I hope my whitepapers and ideas get tested and used and if they confirm to work my published papers may possibly become true or may lead to a true discovery that will bring free energy that will cut enough fees to restore this nation or cut enough debt to get out of any recession or depression.
